

ABSTRACT OF THE DISCLOSURE

A faucet assembly comprises a main body, a fastening seat, a locating plate, a fastening bolt, and a lift rod. The fastening seat is formed of a base, an upper portion, and a lower portion. The fastening seat is mounted on the upper side of a sink such that the base is rested on the sink, and that the upper portion is disposed in the main body, and that the lower portion is put through a through hole of the sink. The fastening seat is provided with a water duct in communication with a water admission hole of a stem of the main body and with a water supply pipe. The locating plate is movably disposed in the underside of the sink such that the locating plate is driven by the fastening bolt to press against the sink. The fastening bolt is held by the fastening seat.
